Introduction

Make it easy as possible to collect and share high-quality, interoperable environmental surveillance data

Warning

This documentation for PHES-ODM Version 2.0.0 is in the beta testing. Please be aware that changes will occur regularly in the next weeks. If there is something you'd like to see in the documentation that you cannot currently find, please please [create an issue on our GitHub repository](#) or post about it on [our Discourse page](#).

The Public Health and Environmental Surveillance Open Data Model (PHES-ODM or ODM) is an open-source data model and set of tools aimed at promoting global collaboration and use of environment and public health data. The ODM model facilitates interoperable environmental surveillance and research by improving quality reporting data, enhancing data management, and supporting data provenance and sharing.

This documentation is intended for those who want to understand how the ODM model works, its organizational structure, and how to use it effectively for their program. It is also a useful resource for those who currently use a different data dictionary and wish to share their data with a program that uses the ODM. If you need to share your data with another program that uses a different data dictionary, this documentation can help you compare and create a common cross-walk between dictionaries. The ODM starts as a conceptual model that represents real-world processes

Introduction

through data elements and data relationships, which are common to all environmental and public health surveillance systems.

How to use the documentation

There are three document sections, each with a different purpose.¹

Getting to know the ODM is oriented to understanding the ODM. This section explains the ODM, its structure, and how the model was designed and developed.

How to use the ODM are step-by-step guides to help you use different aspects of the ODM such as report templates.

Reference is a description of each part of the ODM. It serves as a reference for the other sections, and the definitive record of each part, table and set – along with their attributes.

Future documentation

Tutorials and videos are being develop. Tutorials will help newcomers get started. They will be lessons on how to:

- Describe a protocol using protocol tables.
- Make wide names and report templates using wide names.

¹[David Laing and Divio's Grand Unified Theory of Documentation.](#)

Quick start

You can get to know the ODM by imaging how to record a polymerase chain reaction (PCR) test result for SARS-CoV-2 from a wastewater sample.

1. Get oriented to the ODM tables where you record results

Figure 1.: **Figure 1 - Key ODM tables for recording data**

The **Sample** report table ([samples](#)) and the **Measure** report table ([measures](#)) are where you record information about samples and measures.

2. View mandatory and optional data fields in the tables reference guide

You can view mandatory and optional data field here: ([samples](#)) and ([measures](#)). ‘Mandatory’ means they are fields are needed to ensure interoperability.

What are ODM parts and how to find them?

In the ODM, tables are an example of an part. A part name can be identified by its text style like **this**. The part ID often follows the part in parenthesis, with a link to the part.

So, **Sample report table** is the part name, and ([samples](#)) is the part ID and link to the documentation for that part.

You can find out more about parts on the [reference guide section](#).

3. Try entering example data in ODM Excel templates

Keep in mind, ODM templates are only examples of how to use the ODM dictionary to record data. Templates are available at [OSF.io](#). The ‘[How to use the ODM](#)’ section describes how to enter information into tables.

Storing sample data in an ODM template

A **sample** ([sampleID](#)) is defined as a representative volume of wastewater (or other forms of water or liquid), air, or surface area taken from a site. The sample template stores one sample per row. The **Sample report table** has seven mandatory fields.

<https://vimeo.com/802349692>

Storing measure data in an ODM template

A **measure** (**measureID**) is defined as a measurement or observation of any substance including a biological, physical or chemical substance. An measurement is recorded from a specimen (i.e. a site, sample, person or population). The measure template stores on measures per row. If you recorded PCR results for two SARS-CoV-2, say the N1 (covN1) and N1 (covN2) regions, you would record each on its own line. This is referred as the “long” table format, and it is the main format for storing measures. You can create “wide” tables that store multiple measures in one row, or you can mix and match to generate tables that have both long and wide headers. The [European Union airport template](#) is an example of a hybrid template (see the ‘Airports’ folder).

(Video)

4. Next steps

Recording SARS-CoV-2 PCR measures are examples of storing information for a **sample**. You can also record measures for a **site** (i.e. wastewater **flow rate** ([flowRate](parts.qmd#flowRate))), or the **population** served by site (i.e. Covid-19 hospitalization rate for a wastewater treatment plant’s watershed, or municipality). Figure 2 shows subway lines for the these three specimens (**sample**, **site**, and **population**).

The “who, where, and why” for measures is stored in contact tables. “How”, the measure protocol or method, is stored in the **protocols** tables.

Getting help

We hope that the documentation serves its purpose and that you find it useful in figuring out how to best use the ODM and its suite of tools. If

Background

What is PHES-ODM?

The data model specifies how to store environmental measurements taken from specimens such as water (including wastewater), air, and surfaces. In addition, the model includes a standardized, extensible approach to capture sample metadata (i.e., where and how samples were collected), program metadata (i.e., who, what, where, when, and why samples and measurements were taken), and protocols (i.e., how samples were collected and measurements were performed).

The ODM model provides software tools that support the collection and use of data formatted in ODM. These tools include generating data validation, recording data into input templates, generating wide tables for analysis, and producing SQL database definitions for data storage. As an open model, there are extensions to the model by third-parties, such as the (European Union [Digital European Exchange Platform \(EU4S-DEEP\)](#) data templates for wastewater surveillance at airports, the [CETO Epidemiologic platform](#), and [Ottawa Automatic Data Pipeline](#) to analyse qPCR data and transform it to ODM format.

The ODM model aims to facilitate the entire life cycle of environmental data collection, including metadata for Laboratory Information and Management Systems (LIMS) to ensure data provenance and quality control. While a research team can use the ODM to support their data management, its true strength lies in supporting collaborations that seek to share and combine samples and measurements.

Background

Awareness of threats to public health is important for the function of modern health care systems, and environmental surveillance is presenting itself as very cost effective way to monitor for these threats. While environmental surveillance methods, like wastewater surveillance, are not entirely new, they certainly experienced an unprecedented expansion of uptake over the course of the covid-19 pandemic.

Early on in the pandemic, the urgency with which new information was required meant that wastewater monitoring programs started quickly. This was true globally, with data often being collected in desktop spreadsheets and with labs running all their own PCR assays and assessing quality and doing data cleaning themselves. This work was crucial to monitoring viral levels in communities at the time, and so the urgency and speed of expansion which led to a very diverse field was perhaps unavoidable. Namely, the rapidly expanding field meant that new methods and measures were being rapidly introduced, with no consistent approach to reporting findings or coherent data quality standards. The field is also, by its very nature, complex with many systematic, environmental and laboratory-based factors affecting the signal. Furthermore, viral sequencing and other genetic measurements generate enormous amounts of complicated data. Add this to the fact that the field has many stakeholders who generate and use data all over the world, with data management and governance practices that can vary enormously, and are left with a field with struggles sharing and collecting interoperable data.

Objectives and values of the ODM

The over-arching objectives for the ODM are to:

Objectives and values of the ODM

- Include provision for any biological, chemical or physical property, including antimicrobial resistance, drugs and toxins. Biological properties include variants, sequences, alleles, mutations and proteins.
- Include the ability to store data from samples from air, surface samples, and wastewater (water).
- Include protocol reporting, including metadata for methods that may affect measurement across laboratories.
- Include reporting of quality control and assurance. Each measure can have multiple quality control and assurance measures.

ODM accomplishes the objectives with values to:

- *Support Data Custodians and Data Users:* The data model should support data custodians and data users across the lifecycle of environmental surveillance. Users include wastewater laboratories, municipalities, public health (international, federal, provincial, and local), researchers, and others (citizen data scientists, data aggregators, news agencies). The lifecycle includes data collection and management in municipalities and laboratories, surveillance, research and other uses (public reporting by aggregator sites). For the ODM this means supporting users and building tools to support the ODM, and also means that we must make the ODM comprehensive. The ODM includes measures from other wastewater dictionaries.
- *Support FAIR data:* In 2016, a diverse set of stakeholders—representing academia, industry, funding agencies, and scholarly publishers—designed, jointly endorsed, and published the ‘FAIR Guiding Principles for scientific data management and stewardship’.² The intent of FAIR is to improve infrastructure supporting reuse of scholarly data based on four foundational principles: Findability, Accessibility, Interoperability, and Reusability. For the ODM this means making sure that the ODM makes for data that is findable, accessible, interoperable, and reusable by considering these attributes part of the core infrastructure.

²[FAIR Principles](#).

Background

- *Use an open science, open software approach:* Open-source software is software with source code that anyone can inspect, modify and enhance. Open-source initiatives embrace principles of open exchange, collaborative participation, rapid prototyping, transparency and community-oriented development. For the ODM this means that all work on the ODM is hosted in open-access environments, like GitHub, where anyone and everyone can transparently see the work being done, the rationale behind it, and can contribute to the project according to their ability.

Getting to know the ODM

What are “Parts” and “Part Types”?

Within the Public Health and Environmental Surveillance Open Data Model (PHES-ODM, hereafter referred to as simply “the ODM”), every piece or component of the model structure is called a “part”. Regardless of function, all of the tables, headers, and categorical inputs are all parts. This creates a foundational term so that the ODM and its structure can be discussed with greater ease by users and designers.

Because the term “parts” refers to every component of the ODM, “part types” are a way to differentiate between parts which have different functions and structures. The three most important part types are:

- Method Part Type
- Measure Part Type
- Attribute Part Type

Please see the [parts reference document](#) for more details, but essentially methods allow the recording of methods in environmental surveillance and testing, while measures allow the recording of observations and results, and attributes capture metadata.

The remaining 20 part types (for a total of 23 part types) are:

- Aggregation Part Type
- Aggregation Scale Part Type
- Aggregation Set Part Type

For information and details about all the part types, please see the [parts reference document](#).

“Sets” and the rationale behind sets

“Sets” are a way of grouping together different possible categorical inputs within the ODM. The purpose behind sets is to group options together so that users only need to check a few options from a drop-down menu, rather than scroll through a long list. Sets are also designed so that a single part can be used in multiple sets, which avoids the need to create multiple versions of this part for these different use contexts. For example, if you’re taking a measure of concentration, that measure will likely populate the unit choice drop-down list with units from the “standard concentration unit set”. Units in this set include Milligrams per litre, parts per million, and Percent Primary Sludge. Similarly, if one were measuring the amount

“Sets” and the rationale behind sets

of oxygen in a wastewater sample they would be offered units from the “dissolved gas unit set”. The units in this set include parts per million, and Milligrams per litre. You see here how Milligrams per litre is used twice across the sets, but exists still as a single part in the parts list. Unit sets are only one type of set, with the others being:

- Aggregation sets
- Compartment sets
- Quality sets
- Specimen sets

Details about these sets are their similar - but unique - applications can be found in the [parts reference document](#). Importantly, “category sets” are not considered a “set” like these others. See the section below for an explanation of this difference.

Why category sets are treated differently

One of the reasons why “sets” are set up and organized the way that they are, is to allow for the re-use of parts in multiple sets. Category sets are, however, an exception to this rule because the categories that make up a category set are used in only one set. Furthermore, the general sets are needed for almost every measure or method (which require unit, aggregation, quality, and compartment information), while category sets are used only in specific circumstances for specific fields. These are things such as collection metadata (example: Sample collection category set), dictionary metadata and model architecture (example: Data Type Category Set), or more detailed types of certain methods (example: Nucleic Acid Extraction Category Set). Category sets are also a distinct part type, and more information about them can be found in the [parts reference document](#).

The “what” and “why” of Specimen IDs

Specimen IDs indicate the level at which a measure is being done. This can be: a site measure, ie. a measure at a site such as temperature or weather; a sample measure, ie. a laboratory measurement on a sample, such as gene copies of SARS-CoV-2 per mL; a person measure, ie. a measure of something at the level of an individual person, such as a blood pressure reading; or a population measure, ie. an aggregate measure of a population, such as the number of confirmed cases of a given illness. While there is currently nothing in version 2.0 of the ODM with uses the person specimen ID explicitly, it has been included to allow for the possibility of storing individual-level data in a future version. The reason specimen IDs were created was so that there could be a single manner in which measures and methods are recorded, regardless of the level at which they were performed, while still maintaining the possibility to collect site, sample, and population measures as a distinct types of metadata.

The “what” and “why” of Groups and Classes

Groups and classes, similar to sets, are ways of grouping together different measures within the ODM. Given that the ODM aims to be as robust as possible and has a very long list of possible measures, groups and classes were designed to give shorter lists of measures in the drop down lists by specifying details about the kind of measure that a user is recording. Groups and classes can work together to further specify what kinds of measures are being reported. For example, the group `sarsCov2` contains many measures, but by specifying that the class is an `allele` or `variant`, the list of possible measures is pared down. Alternatively, class can be said to be non-applicable, paring down the measures in the `sarsCov2` group to only be unspecified measures of the quantity of the virus.

Tables and table types within the ODM

Within the ODM there are three types of tables: program description tables, results tables, and look-up tables. These table types exist to differentiate the function of these tables and to highlight these differences to users. The different tables take different types of inputs and maintenance from users, so understanding the differences can be important.

Program description tables

Program description tables (represented in yellow in the ERD) are tables used to record metadata on the organizations, locations, methods, and appurtenance. These tables help to describe surveillance and testing programs, and are intended to be updated infrequently.

Results tables

Results tables (represented in blue in the ERD) are the tables used to record details on samples and measures. These tables record the main outcomes data and are updated daily, if not more frequently.

Look-up tables

Look-up tables (represented in green in the ERD) are the tables that are pre-programmed and pre-populated in the ODM. These hold information on sets, all parts, languages, and translation abilities. These are only updated by the ODM team in version updates.

Measures, Methods, and Attributes: Key parts

While there are many part types, there are three main part types users should be most familiar with: measures, methods, and attributes. These three have parallels with the three table types, and the differences and details of these parts are useful to understand.

Measures

Measures are actually types of measures that can be performed. These can range from temperature to the number of gene copies in a sample. The measure, or `measureID`, can be selected from a drop down in the templates and it specifies the kind of measure you intend to record. The actual value of the measure is then recorded in the `value` field of the `measures` table, with units and aggregation specified in the `unitID` and `aggregationID` fields.

Methods

Similar to measures, methods are types of methods that can be performed to accomplish a measurement. These can be diverse, ranging from incubation, qPCR, or nucleic acid extraction. The method itself (`methodID`) is selected from a drop down in the templates, specifying in general terms the kind of method the user wishes to record. From there, the `value` field of the `methodSteps` table can be populated by one of the inputs from the category set associated with that `methodID`. This provides a higher level of detail for a given method. For example, the `methodID` might be `solidSep` for solid separation of a sample. The value field might then be populated with `cent` for centrifugation, indicating more details about how the sample settling was done.

Attributes

Attributes are the largest category of part type, as these refer to any most of the fields in the ODM. Attributes are fields for metadata within the ODM and range greatly in the use. They comprise everything from collection dates, to sampling period, to names.

Data quality and reportability

Within the ODM there is a `qualityFlag` field present in both the `samples` and `measures` tables. This field serves to highlight whether or not there is a quality issues with the sample or the measure. The quality flag also allows a user to specify to type of quality issue. This is managed through the use of quality sets, which are the sets that contain the possible quality flags for a given measure or for samples. The idea is that this provides data on any issues with a sample and an indication of the nature of that issue. Having data about the nature and presence of a quality issue is often not sufficient for decision makers who are trying to use and interpret the data. As such, there is also a `reportable` field with is a Boolean indicator of whether or not data can or should be reported or included in final reports and decisions.

Time periods for samples and measures

For measures, there is a field `aDateStart` and `aDateEnd` which specify the date and time that an analysis was begun and finished. This allows for the recording of greater detail around timelines for especially long, multi-day analyses. For shorter analyses, which will likely make up the bulk of reported measures, the same date can input in both fields. The idea is to have the reporting tables for measures be as robust as possible to allow for various kinds of timelines.

Getting to know the ODM

For samples, there is `col1DT`, `col1DTstart`, and `col1DTend`. The first field is for the collection date and time of a single grab sample, so start and end are not necessary and the other two fields can be left blank. For composite or pooled sample, the start and end date and time for collection is crucial information to know. When these two fields are populated, the `col1DT` field can be left blank.

Dates within the ODM

There are a number of date fields within the ODM which all serve different purposes. Collection datetime (`col1DT`) is the date a sample was collected, used only for grab samples. This field is left blank if the collection datetime start and end fields (`col1DTstart` and `col1DTend`) have been populated instead. Inversely, collection datetime start and end fields should be left blank if the collection datetime field has been populated. Similarly, analysis datetime start and analysis datetime end (`aDateStart` and `aDateEnd`) are used to report the date and or timeline of an analysis for a measure.

Date fields that are more related to data processing and laboratory infrastructure are: the last edited date (`lastEdited`) which indicates the last time a table, or a measure or sample details, were last edited or updated; the sent date (`sentDate`), or date that a sample was sent to the lab from the field; the received date (`recDate`), or the date the sample was received in the lab; and the report date (`repDate`), or the date that the analysis results or measures were reported. These give a greater indication of how up to date data is, but also on the speed and efficiency of the pipeline between sampling and reported results. Dates should be reported in day/month/year format to accommodate the most popular global convention.

Translation and language capabilities

The default language of the ODM is English, but French translations of all descriptive elements of the data model dictionary are also available. As additional nation states and partners adopt the ODM, we anticipate that these fields will be translated into other languages as well. The translation capacities are managed through the language look-up table (`languageLUs`), the translation look-up table (`translationLUs`), and the parts table (`partsLUs`). When a translation for a given part is not available, the dictionary will default to the English term. The language look-up table stores linguistic and classification codes for spoken human languages, with the most recent ISO639 code being the language ID (`languageID`). In the translation table, the language ID is paired with every part ID (`partID`), along with the label (`partLabel`), description (`partDesc`), and instructions (`partInstr`) translated to that language. The part IDs are linked to the full parts list which otherwise contains metadata that is coded in variables and requires no further translation.

Questions and online community

If any users have additional questions or issues with the ODM, we invite them to check out our [Discourse Page](#) for discussion boards and community support. For larger issues, and to ask the ODM team to add additional fields or variables into the model, we encourage users to visit the project's [GitHub repository](#) and to create an issue there so that a team member can respond.

How to use the ODM

How-To guides

1) How to use templates

ODM Excel report templates provide you with an easy way to enter your wastewater and other environmental data into the PHES-ODM format. The templates also serve as an interactive way to get to know the ODM. Below you will find a series of guides that will walk you through how to enter data into the report templates.

In these guides, “field” refers to a column in the template, and “entry” refers to a row of information that you entered. Guides also provide definitions and explanations for some terms; however, more complete information is found in the most can be found in the reference section of the ODM documentation.

The report templates can be found at the OSF.io [PHES-ODM reference file folder](#). More information about the tables can be found in the [getting-to-know](#) section.

Briefly,

- **samples** and **measures** tables are used day-to-day reporting. Information about a sample will be recorded in the **samples** table. Measurements are recorded in the **measures** table. A measure is

How to use the ODM

‘measurement or observation of any substance including a biological, physical or chemical substance’.

- There are three optional tables to support reporting samples and measures.
 - **sampleRelationships** is optional and used only when you have samples that are pooled or split.
 - **measureSets** is also an optional table that can be used to link measures together.
 - **qualityReports** is used for detailed quality assurance and control measures (you can—and should— record a **quality flag** attribute for each measure or sample in the **measures** and **samples** tables).
- Typically, there is one-time initial setup where information is entered the tables with the yellow tabs in the Excel template. These tables include information about **sites**, **addresses**, **organizations**, and **contacts**.
 - **sites** is a mandatory table records information about where testing is performed.
 - **addresses**, **organizations**, and **contacts** provide the contact information for sites and also other entities such as laboratories, or database custodians.
- There are optional supporting tables that include **protocols** and **instruments** where you record information about how samples are taken and measures are reported. These tables are usually completed once and then updated when there are changes to the protocol. **protocolSteps** and **protocolRelationships** tables are part used alongside the **protocols** table. Other supporting tables include **polygons** where information is store about the sample shed

2) How to report Measures and Measure Sets:

and **datasets** which includes information about the data custodian and owner of the data.

The templates contain four main types of fields, each with their own for instructional purposes:

- **Identifier, unique identifier and composite unique identifier (red):** In these fields you will create a value that will be used to identify something. For instance, **Sample** ID is used to identify each unique sample. An identifier can be repeated between entries, while an unique identifier cannot. There is usually only one unique identifier per template, and they correspond to the name of the table. e.g. **Measure** ID for the **measures** table, and **Contact** ID for the **contacts** table.
- **Drop-down and conditional drop-down menus (green):** These fields have a drop-down menu which contain the values that you can either select **or** type in. In conditional drop-down menus, the values depend on what you entered in a previous field.
- **Date fields (purple):** Dates are entered in these fields and must be in the form of the [ISO 8601](#) format: `yyyy-mm-dd`. All date fields also support entries for hours, minutes, and seconds: `2022-01-01T06:11:54` and `2022-01-01T06:11:54+13:30`
- **Free form fields (blue):** In these fields, you can enter your data. Any restrictions will be specified in the relevant sections. Keep in mind, different measures may have different data types that can not be validated in Excel. Data types each measure can be checked in the reference list for the measure. For example, the data type for **temperature** is a real number.

2) How to report Measures and Measure Sets:

In this guide you will learn how to record data in the **Measures** and **Measure Sets** table templates. In the **Measures** table, each row repre-

sents a measure. Along the same lines, in the **Measure Sets** template, each entry will be a collection or set of measures.

Quick Start

Below you will find the mandatory fields for the **measures** Table. You will also find definitions of terms and examples of entries of data, with all of the fields filled and colour-coded. A more detailed description of some of the key concepts can be found in the following section, Detailed description.

Measures Template

1. Mandatory fields

- **Report ID**: Unique identifier for a Measure.
- **Sample ID**: Unique identifier for a Sample.
- **Site ID**: Unique identifier for the location where a Sample was taken.
- **Analysis Date End**: Date the Measure was completed.
- **Measure**: A measurement or observation of any substance including a biological, physical or chemical substances.

1	Report ID	Protocol ID	Sample ID	Purpose	Polygon ID	Site ID	Dataset ID	Report Set ID
2								
3								

i) Columns A-C, and E-H

- These are the identifier fields.

How to use the ODM

- **Report ID** (column A) is the unique identifier for this template, and it cannot be repeated. Each Report ID represents a unique measure.

The **Report ID** can be any text field up to 30 characters. If you don't have a method to generate a **Report ID** you can use the ODM recommended formula: {Mathew, can you add the formula here}.

- Other identifiers can be repeated between entries (if needed). For instance, if you enter two different measures from the same sample, then the **Sample ID** (column C) will be the same.
- You may have already created these identifiers in another template. For instance, you may have created **Sample ID** in the **samples** Template.

ii) Column D

- **Purpose** (optional) has a drop-down menu list. In the list, **Regular** is the default purpose.

2. Columns I to M

	I	J	K	L	M
1	Analysis date start	Analysis date end	Report Date	Specimen	Fraction analyzed
2					
3					

i) Columns I to K

- These are the date fields where you can enter the dates associated with your measure in the format yyyy-mm-dd. Including hours and minutes is optional, but all date-entries use the ISO 8601 format. 2022-01-01T06:11:54 or 2022-01-01T06:11:54+13:30

ii) Columns L and M

- **Specimen** and **Fraction analyzed** have drop-down menus. Both fields are optional, but both are recommended.
- **Specimen** is must be included your table has more than one type of specimen. When there is only one specimen, the database table record the specimen type. For example, if your **measures** table include only wastewater sample measures, you can indicate this information in the **databases** table.
- **Fraction analyzed** applies only for water and wastewater samples. You should record the fraction for all samples if they are component type water or wastewater.

3. Columns N to S

	N	O	P	Q	R	S
1	Group	Class	Measure	Value	Unit	Aggregation
2						
3						

i) Columns N and O

- **Group** and **Class** help organize **Measures** to make a specific measure easy to find. The fields have drop-down menus. Both fields are optional and used only if you need help finding a **Measure**.
- For example, to find the allele measures for SARS-CoV-2 you can start by selecting **SARS-CoV-2** in the **Group** column. Next, you select **Allele** in the **Class** column. Then, you'll see the drop-down in the **Measure** column that contains SARS-CoV-2 allele regions.
- Leave these fields **blank** if you do not use them.

ii) Column P

- **Measure** is where you select what is being measured. A measure in ODM is a 'measurement or observation of any

substance including a biological, physical or chemical substance.’ **Measure** has a conditional drop-down menu. See above section on **Group** and **Class**.

- If you chose to enter in a **Class** (column O), the drop down menu will contain the **Measures** found in that **Class**. If you did not enter a value in column O, the menu will contain all possible **Measures**.
- iii) Column Q - This where you will enter in the value of your **Measure**. - For instance, if your **Measure** is a temperature of 20 °C, you would enter “20”. - Note: Excel accepts any data type can be entered in the **Measure** column. However, each **Measure** has a specific data type. Data types can be found in the reference documentation for each measure. For example, the data type for temperature can be found [here](#).
- iv) Column R
- **Units** is where you enter the unit for your measure. There is a conditional drop-down list of the units that are valid for the measure in column P. For example, if the measure is [Storate temperature] (.../parts.qmd#sTemp), the only unit displayed is Celcsius.

v) Column S

- **Aggregations** is where you enter the aggregation of your value. There is a conditional drop-down menu field which contains the types of aggregations of your value. For example does your value represent a mean, median, etc.
- What appears in this menu list depends on what you entered in the Unit field (column R).

4. Columns T to AA

	T	U	V	W	X	Y	Z	AA
1	Nomenclature	Index	Measure License	Reportable data flag	Organization ID	Contact ID	Update Date - Last Edited	Notes
2								
3								

i) Columns U, V and AA

- **Index** (column U) is used if you have multiple entries with the exact same values in the other fields. If this is the case you could use “1”, “2”, etc. to differentiate them.
- **Measure license** (column V) refers to the access and use licensing of the measure that you are entering.

ii) Column T and W

- **Reportable** (column W) is where you can indicate if there are quality concerns with the measure and the measure should not be used for regular reporting. More details of the quality concerns can be recorded in the **quality sets** table. There is a drop down list this field.

iii) Column X and Y

- These are identifier fields that are used to indicate the **Organization** and **Contact** associated with the entry.

iv) Column Z

- **Last edited** field is where you indicate the date when the entry was updated. The field is used if you need to modify an entry (row) after your initial recording. You can leave

How to use the ODM

this field blank if the measure was entered with no updates.
Meaning, use this field only when you modify the entry (row).

- Report Set ID (column A) is the Unique Identifier for this template, and cannot be repeated between entries. In essence, each value of Report Set ID represents a unique Measure Set.
- For the rest, you can repeat the Identifier between entries (if needed). For instance, if you are entering two different Measure Sets that came from the same Organization, then the Organization ID (column D) will be the same.
- You may have already created these Identifiers in another template. For instance you may have created Organization ID in the Organizations Template.

ii) Columns C and G

3) How to report Samples and Sample Relationships:

- These are Free Form fields in which you will enter the indicated information. Name (column C) refers to the name that you have given to the Measure Set.

iii) Column F

- This is a Date field in which you can enter in the date when the entry was updated.

You have now entered your data in the Measures and Measure Sets Template, congratulations!

3) How to report Samples and Sample Relationships:

In this guide you will learn how to enter Samples and Sample Relationships into their respective templates. In the Samples template, each entry represents a Sample. A Sample is the wastewater that you collected so that Measures can be made. Along the same lines, each entry in the Sample Relationships represents an interaction (or Relationship) between two Samples in the form, Subject - Relationship - Object. So, to specify that Sample A is a field sample replicate of Sample B, you would enter “Sample A” - “Field Sample Replicate” - “Sample B”

In this guide you will learn how to enter Protocols, Protocol Steps and Protocol Relationships into their respective templates. As described in , a Protocol is “A procedure for collecting a sample or performing a measure”. Each entry in the Protocols Template represents a unique Protocol. A Protocol is made up of Protocol Steps. In the Protocol Steps Template, each entry is one of these steps. Finally, Protocols and Protocols can be linked to each other. Each entry in the Protocol Relationships Template represents one of these relationships in the form, Subject - Relationship - Object. So, for example, to specify that Protocol Step A needs to be done before Protocol Step B, you would enter “Protocol Step A” - “is Before” - “Protocol Step B”. .

i) Columns A to C, E and F:

- These are Identifier fields.
- All of these Identifiers are either Protocol IDs or Protocol Step IDs and represent Protocols and Protocol Steps, respectively. This includes Protocol ID Container (column A), which represents the Protocol that contains the relationships that you are entering in this template. Note that none of these fields are Unique Identifiers and, thus, can be repeated between entries.

How to use the ODM

- You should only enter in a value for one of the two “Object” columns (column B and C); this depends on whether the Object of the relationship that you are entering is a Protocol or a Protocol Step. The same is true for the two “Subject” columns (column E and F).
- An example will be given in point (ii) below.

ii) Columns D:

- This is a Drop-down Menu field, where you can select the type of Relationship that is being entered.
- For example, say you wanted to enter in a Relationship stating that Protocol Step A takes place before Protocol Step B in a particular Protocol Container. You would enter the relevant Identifiers in the Step ID Object field (column B) and the Step ID Subject field (column F). You would then select “is Before” from the Relationship field. Finally, to identify this relationship, you would enter in the Identifier in the Protocol ID Container field (column A)

You have now entered your data in the Protocol Steps, Protocols and Protocol Relationships Template, congratulations!

5) How to report Metadata:

In this guide you will learn how to enter Metadata through a series of templates. Each entry in a template will usually represent what is found in the title of the template. For instance, in the Organizations template

each row will represent an Organization. In the context of the PHES-ODM, metadata is anything that gives information that is not found in the templates related to Measures, Protocols and Samples.

Reference guide

The reference guide is a technical description of the ODM **parts**. There are three sections to the reference guide.

- **parts** – Parts are the smallest way of describing anything in the ODM. An analogy to parts of a car can be used to illustrate this point. If you own a car, your garage can access a parts list that contains every part of your car, right down to every nut and bolt. There are over 900 parts, all listed in alphabetical order. Each part has up to 60 different attributes such as the part name and description.
- **tables** - The ODM database model has 21 tables in its full relational database. The full model is commonly referred to as “long” tables as it stores data with one measurement per row. The most important tables are the ‘report’ tables that are used for daily reporting of measures and samples.
- **sets** - Sets are lists or collections of parts. You can think of sets as the elements of drop down lists or categories.

💡 Did you know that each part ID has its own URL?

Every part, table, and set has its own URL, that is created using the partID. partIDs are usually parentheses that follow a part, table, or set name.

For example, ‘airport’ is a sample shed category which would appear as: **Airport** (**airport**). The permanent link to the airport partID is, <https://docs.phes-odm.org/parts.html#airport>. Airport also is listed in the **Sampleshed** category set (**shedCatSet**).

Parts

ODM version 2.0.0-rc.3.10.

Parts are the smallest way of describing anything in the ODM. An analogy to parts of a car can be used to illustrate this point. If you own a car, your garage can access a parts list that contains every part of your car, right down to every nut and bolt. Similarly, the ODM has a **part ID** ([partID](#)) and **part description** ([partDescription](#)) for every measure, method, and attribute. There are also **part IDs** for **units**, **aggregations**, and other **parts**. The part list is presented below.

💡 Did you know you can identify part IDs by their specific naming format?

Each part ID starts with a lowercase character and contains no special characters. Parts have less than 12 characters, while part types such as units and aggregations have a maximum of seven characters. The unique construction of part IDs serves several purposes in addition to generating valid URLs. Users can create wide table variable names (headers) using part IDs that are valid in all open software languages. ODM supports a standard method of generating wide variable names by concatenating partIDs with an underscore, `_`. For this reason, some part types have a limit of seven characters to ensure the total length of wide names remains less than 35 characters, which is the character limit length of some statistical language software. The wide variable naming method will be added to the documentation.

Collection number and period

(collNumPer). Composite collection number.period. This a composite measure that combines **collection period** (collPer) and **collection number** (collNum). Collection number and period can be used to reduce the number of table headings during data collection. In data storage, collNum and collPeriod should be transformed to collPer and collNum. For Grab sample, Surface swab, or Area proportional sample just enter 1

In case of Composite, Flow-proportional collection, the number of subsamples followed by a dot, followed by the period of the sampling, in hours. For example, for 4 composite subsamples covering a 8 hours period, the entry would be 4.2 For time-proportional 24 subsamples collected every hour, the entry would be 24.1 For volume-proportional, the entry for 24 subsamples collected over 24 hours should be 24.24, in this case the period

Parts

part of the entry should be understood as the total collection time instead of the periodicity of the collection.

For a COSCA ball or Moore swab collecting for 24 hours, the entry would be 1.24 *Part Type*: attribute *Domain ID*: naDomain *Speciment ID*: saSpecimenSet *Compartment Set*: naCompartmentSet *Group ID*: colGrp *Class ID*: naClass *Nomenclature ID*: naNomenclature *Ontology Reference*: NA *Category Set ID*: NA *Unit Set ID*: naUnitSet *Aggregation Scale ID*: NA *Quality Set ID*: genQualitySet *Reference Link*: NA *Data Type*: varchar *Minimum Value*: 1:1 *Maximum Value*: NA *Minimum Length*: 0 *Maximum Length*: 6 *Part Status*: active. Composite sample - archival

(comp). A composite sample, usually generated by an autosampler. This is intended for use in updating and mapping archival data into the newest version of the ODM. Generally, autosamplers do time or flow-proportional sampling, and so those collection methods should be used instead. This is only for composite/autosampler samples where these additional details have not yet been specified. Use collectionPeriod to describe how many hours the sample was taken, and collectionNum to record the number of samples. *Part Type:* category *Domain ID:* naDomain *Speciment ID:* saSpecimenSet *Compartment Set:* waterCompartmentSet *Group ID:* colGrp *Class ID:* naClass *Nomenclature ID:* naNomenclature *Ontology Reference:* NA *Category Set ID:* NA *Unit Set ID:* naUnitSet *Aggregation Scale ID:* NA *Quality Set ID:* sampleQualitySet *Reference Link:* NA *Data Type:* varchar *Minimum Value:* NA *Maximum Value:* NA *Minimum Length:* NA *Maximum Length:* NA *Part Status:* active. Compartment sets

(compSet). Sets of compartments. Compartment sets are used to identify when a measure can be recorded for more than one compartment. For example, SARS-CoV-2 can be measured in people (humans), water, surface, or air. Sets are lists of input values. Each input value within a set is a part (has a partID) that can be reused between sets. For example, a set A could

Parts

contain the values of ‘yes’ and ‘no’; and set B could contain the values of ‘yes’, ‘no’, and ‘maybe.’ partTypes with sets include aggregations, compartments, missingness, quality flags, specimens, and units. Measures with categories and dataTypes have their own specific category sets (catSetID) because their input values are unique and are not reused. *Part Type:* part-

Last edited

(lastEdited). The date the entry was last updated. Use lastEdited if an entry is updated. Leave lastEdited blank or 'NA' for the first entry. Updates can include additions or revisions of the entry for any reason. For example, a wastewater measure was repeated later with an improved method. You can revise the entry by updating the value and then adding the date the new measure was performed to 'lastEdited'. To ensure data provenance, the best practice in this example is to generate a new entry with the same measureID as the original measureID. The original and new measures are kept in the database with a date in the 'lastEdited' field for the new entry but not the original one. Some databases may choose a delete-and-replace approach where the original entry is deleted and replaced by a new entry. In this approach, the 'lastEdited' field indicates the delete and replace occurred. *Part Type:* attribute *Domain ID:* naDomain *Speciment ID:* naSpecimenSet *Compartment Set:* naCompartmentSet *Group*

Part ID

(partID). The unique identify of any entity within the dictionary. Every entity in the ODM has a partID. The partID must be unique with no duplicates. partIDs are short. partIDs that are constructed by different part attributes can be up 28 characters (check max), but each part attribute should be 1 to 5 characters. partIDs are machine readable, but a knowledgeable user can understand what they represent. partID are used, for example, as a header in an Excel input table. Numbers are allowed but there no other special characters other than `_`. `_` is a reserved character that is used to generate a partID using a component or table attributes. A partID for a subComponent is automatically generated using attributes of a component. For example, the partID for the component SARS-CoV-2 is covid. Covid can have many subComponents including different groups (Covid-19-al, Covid-19-va, ovid-pr (allele, variant or protein) or units and aggregations (i.e. covid-al-N1-mean-cpl representing ovid allele N1, mean observation of viral copies per litre of effluent). A similar approach to naming subComponent is use for naming parts in a reprotTable. *Part Type: partSupport Domain ID: naDomain Speciment ID: naSpecimenSet Compartment Set: naCompartmentSet Group ID: naGroup Class ID: naClass Nomenclature ID: naNomenclature Ontology Reference: NA Category Set ID: NA Unit Set ID: naUnitSet Aggregation Scale ID: NA Quality Set ID: NA Reference Link: NA Data Type: varchar Minimum Value: NA Maximum Value: NA Minimum Length: 0 Maximum Length: 28 Part Status: active. Protocols are a group of related protocol steps. For example a protocol step can describe a sample concentration, extraction, inhibition or a measurement. Protocols can include both methodID (a procedure) and measureIDs (a measure). An example of a method is centrifugation; where the centrifugation rotation speed is described as a measure. *Part Type:* table *Domain ID:* naDomain *Speciment ID:* naSpecimenSet *Compartment Set:* naCompartmentSet *Group ID:* naGroup *Class ID:* programDescr *Nomenclature ID:* naNomenclature *Ontology Reference:* NA *Category Set ID:* NA *Unit Set ID:* naUnitSet *Aggregation Scale ID:* NA *Quality Set ID:* NA *Reference Link:* NA *Data Type:* varchar *Minimum Value:* NA *Maximum Value:* NA *Minimum Length:* 0

Sets

ODM version 2.0.0-rc.3.10.

Sets are lists of categories and other parts. For example, `Collection category set` ([collectionCatSet](#)) contains a list of the different collection types including: `Moore swab`, `Grab sample`, `Flow proportional sample`, etc.

Sets can have parts that are reused. For example, there are different quality measures for sample collection (e.g. `Sample not collected`), PCR measures (`inhibition preset`), and sequencing measures (`low depth of coverage`), but all quality sets share the `No quality concerns` indicator.

Tables

ODM version 2.0.0-rc.3.10.

The ODM database model has 21 tables in its full relational database. The full model is commonly referred to as “long” tables as it stores data with one measurement per row. Each table has mandatory and optional headers.

i Data storage

Store all ODM data in the 21 recommended tables to ensure optimal interoperability and support by the [ODM validation toolkit](#) and other ODM libraries.

Users can, however, create custom tables or ‘views’ by merging fields from any table. A common format for data entry format are “wide” table format, with *one day per row* and multiple measures or attributes per row. It is important to note that this guide does not provide instructions on generating wide tables.

Table types

There are five table types:

1) **Regular report tables.** The **measures** and **samples** tables are used for daily reporting of new measurements and information on sample collection. There are three tables that support regular reporting:- **measureSets**

Tables

(optional) is used to link measures, `sampleRelationships` (optional) is used when samples are pooled or split, and `qualityReports` is used for detailed quality assurance and control measures.

2) **Contact information tables.** The `sites`, `organizations`, `contacts`, and `addresses` tables store contact information for the testing site and the person who performed the testing.

3) **Protocol or methods tables.** The `protocols` and `instruments` tables hold information on the methods used for sample collection or measurement. `protocolSteps` and `protocolRelationships` tables are used in conjunction with the `protocols` table.

4) **Other report tables.** The `polygons` table stores information on the sample area and the `datasets` table includes information on the data custodian and owner.

5) **Dictionary reference tables.** The `parts` table describes all elements of the ODM, including tables, table headers, measures, methods, categories, and units. The `sets` table stores collections of parts, such as units grouped together in a `unitSet`. The `languages` and `translations` tables support translations.

Header roles

Each table in the ODM has column headers, also known as table variables, fields, or entity relationship attributes. The header serves as the top row and contains the variable name.

Primary key (PK) - With the exception of the dictionary tables, all tables have one primary key. The primary key serves as a unique identifier for each row in the table, meaning that a primary key value cannot be repeated.

Mandatory, optional, mandatoryIf

Foreign key (FK) - Tables may have one or more foreign keys. A foreign key connects an entry to another table with a primary key. This allows for relationships to be established between tables, making it possible to link data between different tables.

Header (header) - This label is used in a table description when a header is not a primary or foreign key.

Mandatory, optional, mandatoryIf

Each header may be classified as either **mandatory** or **optional**. In the **measures** table, examples of mandatory headers are the **measureID** and **measurement date**. The ODM validation toolkit can be used to validate data, and will return an error if a table lacks a mandatory header or if there are missing row entries for mandatory fields.

Additionally, there are special headers called **mandatoryIf** headers. These headers are mandatory if certain conditions apply. For example, the **protocol steps** table has row entries that are either **measures** or **methods**. If the row entry is a **measure**, then a **unit** becomes **mandatory** since all measures must have a unit. Therefore, units are **mandatoryIf** in the protocol steps table.
